The higher economic, health, and social concerns facing older adults with HIV are critical issues that need to be addressed. The lack of research devoted to LGBT populations in these fields emphasizes the need for further investigation. As baby boomers move into midlife, the percentage of older adults at risk for HIV will increase. Social workers in many different fields must be aware of the effects of the virus and the need for policy and practice changes. Implications for future HIV/AIDS research and the largest at-risk group among older adults, three of the fastest-growing, and activity groups, and one health and social service program/agency are discussed. Research shows that among adults in China, intravenous drug use and sexual practices of women in midlife and older are significant factors. This study has important implications for social service research and policy efforts directed at older adults infected with HIV/AIDS. Research shows that among adults in China, intravenous drug use and sexual practices of women in midlife and older are significant factors.
